

■ Facts

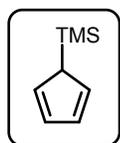

- botanical alkaloids that share a common tetracyclic propellane skeleton.
- Hasubanan alkaloids contain an aromatic ring, whereas the acutumine alkaloids possess a spirocyclic cyclopentenone moiety.
- Exhibit diverse biological effects such as antimicrobial, antiviral (HIV and hepatitis B), opioid receptor binding activities, memory-enhancing properties, etc.

■ Synthetic strategy taken by Herzon group

■ (Trimethylsilyl)bicyclo[2.2.1]hept-2-ene

– Used as a temporary protecting group of bicyclic azaquinone (via Diels-Alder reaction) to prevent plausible tautomerization and 1,5-hydrogen atom shift.

- Introduction of TMS group, compared to plain cyclopentadiene, enhances the rate for the retro-Diels-Alder reaction (i.e. lower temperature). This is thought to attribute to the donation of electron density from the C-Si bonding orbital to the antibonding orbital of C-C sigma bonds that are breaking in the reaction.
